Potential competing interests: No potential competing interests to declare.

Dear author, first of all, I congratulate you for your research and effort. To get to the point, the empirical methodology of your research is appropriate. However, although you have used NARDL in the abstract of your research, we see both ARDL and NARDL methods in the content section. Is your study based on linear or non-linear data? First of all, this situation needs to be clarified and depending on the situation, you need to choose either ARDL or NARDL methods and you should especially mention this in the empirical methodology section. On the other hand, although there is no problem in your CUSUM graphs for both ARDL and NARDL, stationarity is not observed in your CUSUMsq analyses. This is an indication that your model is not stationary. I especially recommend you to make the necessary adjustments at this point. Because in this case, your results will be seen as problematic. In terms of results and policy recommendations, adding your original comments will allow your study to contribute more to the literature. I advise you to review your study again by taking these points into consideration and wish you continued success.
