Potential competing interests: No potential competing interests to declare.

1. What are the innovations in this paper? I recommend the author to include at least three specific innovative points. Additionally, the paper does not clarify the advantages of its method compared to previous methods or what issues it addresses in existing approaches. I would like the author to provide this information as well.
2. Why did the author split the dataset into only training and testing sets without a validation set?
3. There is an issue with the curve plotting in Figure 15.
4. I suggest adding a final paragraph in the experimental section to summarize all the experimental results and highlight any limitations.
5. The overall number of references is still insufficient. I recommend that the author continues to add more references. If the author has difficulty finding suitable references, I can recommend several references for their consideration:
  - 1 Dbgare: Across-within dual bipartite graph attention for enhancing distantly supervised relation extraction
  - 2 Global Interest Transfer Guided Session-based Recommendation
  - 3 Query recommendation based on improved query flow graph
