**Potential competing interests:** No potential competing interests to declare.

This study is well designed and conducted, but there are some flaws in the methodology, which are listed below:

1. Check the concentration of the extract: 10,100,100.....
2. Please write the extract concentration in a separate table for all experiments.
3. Please check all p values, while  $p < 0.05$  was assumed to be significant, you did not write  $p > 0.999$ , this should be written as  $p = 0.999$  or  $p > 0.05$ .
4. The mortality rate was ignored in the methods and results.
5. Kidney graphs are not clear.
6. The discussion is not strong. This study has more results, so it's best to rephrase and discuss the health concerns.

BEST REGARDS
