Potential competing interests: No potential competing interests to declare.

- The topic is interesting; however, there are several reviews on this species; hence, the authors should try a systematic review approach.
- Expand the common geographic places where the plant is used in the abstract.
- What do the authors mean by "Unite its phytoconstituents and its pharmacological activities of this plant"? The aim of the review is vague and must be reviewed.
- Lack of references throughout the review—kindly ensure that each sentence has a reference to the literature.
- The introduction largely focuses on the species in India; hence, maybe focus on the species found in this region only.
- Tables should be used to summarize the phytochemicals and biological activities of this species.
- Major English and grammar editing is required.
- The sub-sections of biological activities require more information and comparisons to the literature, including the possible reasons for variations in the results.
