Potential competing interests: No potential competing interests to declare.

This study investigates the prevalence of the Buruli ulcer disease in the Jasikan municipality of Ghana. This information collected in this study might be helpful in planning and policymaking. Besides, below are my suggestions.

1. Adding the country name to the title would be clear to identify the study region.
2. The authors should include the gold standard of the diagnosis in the introduction section, as well as the routine diagnosis practice of the disease in that region.
3. Information about the clinical treatment that is used for this ulcer should be incorporated into the manuscript.
4. The author should compare their outcomes with those of other relevant studies in nearby areas.
5. A geographical map of the country marked with Jasikan municipality could be considered.
