Dear authors,

The article "Techno-Economic Fermentative Microbe-Based Industrial Production of Lactic Acid (LA): Potential Future Prospects and Constraints", brings important considerations on the use of sugarcane bagasse and the processes that can be applied for its use in production of lactic acid. However, for the reader to understand the text, I suggest some changes.

The summary could be more concise and highlight what is interesting about your article.

Some concepts can be better explained, a figure could be inserted showing the components of sugarcane bagasse and where they are located in the structure of the plant or sugarcane bagasse, the reader may not have the idea of what the structure of lignin, cellulose and hemicellulose.
