Dear Editor

Thank you for the opportunity to review the manuscript "Traditional phytotherapies used by the midwives for the treatment of uterine prolapse in district Kathua, JKUT, India"

The research topic was fascinating. Despite technological advancements in the diagnosis and treatment of gynecological and midwifery diseases, I believe that natural inspiration should not be overlooked. Using the experiences of traditional midwives with extensive experience in this field can be a suitable field for conducting research, particularly clinical trials to demonstrate efficacy. However, we should be aware that, while such natural treatments may be effective in mild cases of prolapse, they cannot replace hysterectomy, which is the only treatment for severe prolapse. As a result, the author should write the problem statement in the introduction section. Consider this issue before proposing this method as an alternative to hysterectomy.
