

Review of: "Are Large Language Models obsolete? And are multimodal solutions inappropriate?"

Bhuvanesh Singh

Potential competing interests: No potential competing interests to declare.

The article is very brief, and the language used will not be easily understood even by people working in LLM. The abstract is not very clear about what the author wants to say.

When the author says, "The abstract suggests that language development is deeply intertwined with sensory-motor processes due to lateralization and exaptation," it should also provide direction for its implementation.

ChatGPT-4 is current and working to come up with a newer version, which is already including audio and video. It is working fine and is very extensively used without lateralization.

The theory provided lacks technical details and its practical implementation. The code provided by the ChatGPT link is mostly an algorithm rather than practical code.

The author should write a more comprehensive article explaining the need for this novelty. Include the diagram for better understanding.
