Potential competing interests: No potential competing interests to declare.

The authors organised a questionnaire in order to assess Nigerians' awareness of PFAS-induced human and environmental health issues.

The authors asked volunteers who filled in the questionnaire about their age, gender and level of education. Do you happen to have information on the geographical origin of these people, i.e. rural or city.

I recommend, in addition to reporting the tables, to also make correlations between the answers showing the level of information and gender/age/level of education, from these relationships one could identify the categories most lacking in information and plan appropriate awareness campaigns.

The work in this way would have a higher information level for local political managers.

Other observations

Introduction: always indicate bibliographic references when reposting information e.g. There are reports indicating that which reports

Materials and

methods: how the survey was distributed, web, paper, google forms etc.
