The article is very similar to a report, straying far from a scientific work. The work requires more data for analysis and interpretation. The methodology presented is not clear, requiring a better description. The summary is very weak; it lacks basic data, such as the work methodology, how the samples were collected, how they were analyzed, and a description of the most important data obtained in the work. Data analysis lacks the use of statistics to be able to relate current data with old data or old works. It remains to describe the study area in greater detail, such as location, coordinates, and data that best characterize the area. In figures 3 and 4, if the text is in English, the cardinal points must use English symbols, such as NW and not NO. Figures 5 and 7 do not show a scale and do not have a map of their locations. In figure 9, what is the unit of the ordinate axis data? The conclusions are very simple and bring nothing new. However, the subject addressed is of great scientific interest.
