# SWP73

National Cancer Institute

## Source

National Cancer Institute. *SWP73*. NCI Thesaurus. Code C19841.

A 73 kD subunit of the SWI/SNF global transcription activator complex, SWP73 assists gene-specific activators through nucleosome/chromatin remodeling. The SWI/SNF complex is required for induced expression of many genes and alters chromatin structure to facilitate binding of gene-specific dedicated transcription factors. SWP73 is a non-specific RNA polymerase II transcription factor and homologue of Rsc6p subunit of the RSC chromatin remodeling complex with similarity to yeast ycr52w. (from SGD S0005306 and NCI)
