Potential competing interests: No potential competing interests to declare.

This is a very interesting and relevant topic, as the role of tobacco as a risk factor for fracture healing is increasingly studied. The manuscript is well-organized and demonstrates a correct methodological approach. However, the authors should include a dedicated "Results" section to clearly present their findings from the data analysis. Additionally, the "Discussion" section could benefit from a more thorough comparison with existing literature. Specifically, the authors should elaborate on what other studies have reported regarding the impact of tobacco on fracture healing and describe the prevailing trends and perspectives in the field. What do the authors think to add to the existing body of knowledge?
