**Potential competing interests:** No potential competing interests to declare.

The article talks about the home security sensor system, and although the authors show the system's feasibility, the evaluation scenario needs to be discussed in detail. The evaluation figures need significant improvement, as they do not convey the performance accuracy of the system and its shortcomings.

The overall motivation of the work can be improved. The authors should have discussed the challenges associated with this work and how related work in this field cannot solve this problem, which needs to be clarified at the current state.
