Epinephrine Secretion Inhibition

National Cancer Institute

Source

National Cancer Institute. *Epinephrine Secretion Inhibition*. NCI Thesaurus. Code C41508.

Epinephrine Secretion Inhibition consists of interference with, or restraint of, activities involved in release across the cell membrane into the bloodstream from the adrenal medulla of a sympathomimetic hormone (epinephrine) that stimulates the alpha- and beta- adrenergic systems, causes systemic vasoconstriction and gastrointestinal relaxation, stimulates the heart, and dilates bronchi and cerebral vessels. Alteration of positive or negative feedback mechanisms can affect hormone release.
