Potential competing interests: No potential competing interests to declare.

The paper, Natural Surveillance and Natural Access Control: implementation strategies for enhancing safety in Indian Neighborhoods, through a literature review and a portion of a case study, proposes to the creation of safer neighborhood environments through landscape management, improved road connectivity, and other methods. By constructing a new framework, it can be a reference for future research. However, there are obvious shortcomings in the article. First, it lacks a comprehensive and systematic literature review. Undoubtedly, there is a great deal of literature on how to mitigate crime in landscape management, and further research should be conducted based on the existing studies. Secondly, there is a lack of actual relevant case studies to support this, which makes this thesis look unconvincing and feel like a generalization. Lastly, and very crucial and fatal issue. The paper does not carry out an in-depth discussion and then summarize it into a systematic management scheme or a framework of ideas, which makes the research significance of this article greatly reduced.
