NECTIN2 wt Allele

National Cancer Institute

Source

National Cancer Institute. *NECTIN2 wt Allele*. NCI Thesaurus. Code C142201.

Human NECTIN2 wild-type allele is located in the vicinity of 19q13.32 and is approximately 43 kb in length. This allele, which encodes nectin-2 protein, is involved in viral entry, adherens junction organization and the modulation of receptor-mediated signaling in T-cells. Variation in the gene in subjects with multiple sclerosis may be associated with the severity of the disorder.
