Potential competing interests: No potential competing interests to declare.

The summary presents many results, I suggest that the summary be written in as textual form as possible, without the "($P < 0.05$)". The way it is written, it does not catch the reader's attention. Do not repeat words that are in the title.

The introduction is written in a very direct way, with little connection between the themes, I suggest that the authors pay more attention to this, as readers with little experience in the subject would have difficulty understanding.

Every experimental animal must come from a vivarium, from a controlled environment, never from a market unless this is the objective of the work (always comparing with animals from controlled environments).

Correct English: "Statical analysis" to: "Statistical analysis"

Note in figure 2: treatment E as well as G in 16 days do not indicate statistical groups.

I only notice the presentation of results (summarized, and what I would expect to see in the summary), without actually a clearer conclusion from the authors

NOTE: I see the need for better treatment of the figures, aesthetically, to add more value to the work.
