

Review of: "Gumbel's Extreme Value Distribution for Flood Frequency Analyses of Timis River"

Abdolreza Bahremand

Potential competing interests: No potential competing interests to declare.

This simple, with-no-novelty article, which is like a classroom exercise, needs some correction and improvement: 1. In figure 1, the unit of the elevation has to be added to the map. 2. The article should at least mention the names of some other distributions and discuss the characteristics and advantages of the Gumbel distribution for flood analysis. 3. The symbols in formulas should be introduced properly. For example, while introducing X_T , the author has forgotten to mention what T is.
