Potential competing interests: No potential competing interests to declare.

This kind of article can be published in local magazines or newspapers. However, I, personally, cannot consider it as a pure scientific article. I do not recommend publishing it within this context, though I encourage publishing it for the public.

It is mainly based on mixing theology, spirits, and science when talking about Newtonian, Einsteinian gravity and QFT in the discussion. There is a lack of exact use of equations with their parameters to understand the concept. The difference in polarity in the first figure is not clear. In the second figure, the wrapping, along with the existence of particles (or bodies) and their probabilities, and its relationship with "images unactualised in heaven," needs to be clarified.
