

Review of: "An Intelligent Analytics for People Detection Using Deep Learning"

Mohamed Tahoun

Potential competing interests: No potential competing interests to declare.

The paper compares three well-known deep learning methods and provides a simple comparison among them. However, there are few recent or up-to-date works that should be included in such comparisons. The entire English level is good, but it needs another review. The list of references is mostly old and does not cover the recent advances in that research topic. The paper title can also be modified based on the current experiments.
