Potential competing interests: No potential competing interests to declare.

The report suggests that PAMP immunotherapy may be a potential treatment option for Long-Covid patients. The authors propose that PAMP substances contained in approved drugs or vaccines could stimulate the immune system and alleviate symptoms. The report includes case studies of three patients who experienced substantial improvement in their symptoms after PAMP treatment. The authors acknowledge the need for further research, including clinical trials and immunological investigations, to validate the effectiveness of PAMP immunotherapy for Long-Covid. They also emphasize the importance of collaboration with interested groups for future studies. It is important to note that this case report does not provide conclusive evidence of the effectiveness of PAMP immunotherapy for Long-Covid. Further research is needed to evaluate its safety and efficacy. I think the sample size is too small.
