**Potential competing interests:** No potential competing interests to declare.

The review is well written, but some declarations are needed from the authors

1. Why the title: toxicological evaluation, in spite of the two extracts have several benefits documented in previous researches.
2. How the authors accurately determined the the acute and subacute toxic dose, needs references
3. The authors evaluated significant increase in the body weight of rats, this needs more declaration and discussion.
4. Why the authors did not give high spots on the histopathological and apoptotic effects for the two extracts, especially on liver and kidneys.
