Opinions and suggestions

- 1.The study is a short-term study.
- 2.The purpose of the study is unclear. It's just an observation.
3. Previous studies have indicated that this harmful species has been detected in *Prunus* species in Türkiye. The important point here is that a new host for this pest has been identified in Türkiye. Also, its presence in the wild in July is significant.
4. The name *Prunus cerasus* is often omitted in italics throughout the article. When using a scientific name, it should be italicized throughout the entire article. Please refer to the conclusion and other sections.
5. The page numbers of the first and third references should be given in the references section.
6. The first reference in the reference is written as Maçan T (1986). It should be checked that Sami Maçan and Gülşen Maçan, who were working at that time, wrote this reference incorrectly.
7. This study is purely observational and focuses solely on identifying a new host. The study is publishable.
