Certainly! Here's a constructive comment:

"I appreciate the insightful perspective provided in the article, particularly its value in the field of epidemiology. The detailed description of rodent distribution linked to zoonotic diseases is crucial for devising effective strategies in epidemiological surveillance. Additionally, considering the importance of spatial information, it would be beneficial to enhance the presentation by including the final tables and spatial distribution on an ArcGIS map. This visual representation can offer a clearer understanding of the data and contribute to a more comprehensive interpretation of the findings."
