Acute myeloblastic leukemia with maturation

INSERM

Source

INSERM. (1999). Orphanet: an online rare disease and orphan drug data base. Acute myeloblastic leukemia with maturation. ORPHA:98834

Acute myeloblastic leukemia with maturation is a rare, acute myeloid leukemia characterized by evidence of granulocytic maturation and more than 20% of blast cells in the bone marrow and/or peripheral blood. The maturing non-blast granulocytic cells account for greater than or equal to 10% and monocytic cells less than or equal to 20% of the bone marrow cells. Various degrees of anemia, thrombocytopenia, or pancytopenia are present. Frequent clinical manifestations include fatigue, fever, bleeding disorders, and organomegaly, especially hepatosplenomegaly.
