Firstly, thanks so much for inviting me to review the article entitled " Captive breeding and larval rearing of the endemic ornamental fish Moustached Danio, *Danio dangila* (Hamilton, 1822) – First report".

Although my experience is somewhat far from dealing with ornamental fish, investigation of the manuscript showed that the paper is real work that can make an opportunity to standardize captive breeding and larval farming techniques for such species that could play an important role in raising the biodiversity of the population. Then maintain and meet the demand for aquariums trade.
