

Review of: "Re-emergence of the infectious Monkeypox Virus amidst the coronavirus pandemic: a cause for concern?"

Xia Chuai

Potential competing interests: The author(s) declared that no potential competing interests exist.

The paper focused on the re-emergence of the MPXV amidst the coronavirus pandemic, and summarized the factors halting the efforts being made to curb the spread of the virus and the effects it has on the community. This will provide clues for control the spread of MPXV and prevent it from epidemic. However, there are some issues that could be clarified. For in the sentence "The West African clade has a fatality rate of 3.6% compared to 10.6% of the Congo Basin clade.[7] Although not as high as that of COVID-19, this still highlights the need for more precautionary measures,..." what referred to not as high as that of COVID-19, the fatality or the number of infected people? And I think that the relevant reference should be added. And in my humble opinion, it is better to give a more detailed description of MPXV mutations.
