Potential competing interests: No potential competing interests to declare.

The topic is interesting. Individual subsections, which are very short, do not provide sufficient information. There are more recent articles related to this topic. Additionally, I am missing an indication of what is new or innovative about this method? The authors constantly quote literature, i.e. what is already known on the subject, and do not contribute anything new. Solutions are given, but named as potential applications. The application should be indicated more precisely.
