Dear authors, I would like to express my keen interest in your article and my thanks for having chosen to analyse your work, which tackles a particularly captivating subject and is relevant to solving a topical problem. Your research into the burden of staphylococcus is essential, but a few improvements could further enhance the quality of your work. First of all, I would suggest rewording the title so that it more accurately reflects the scope of the topic addressed. In addition, improving the quality of the English in the text will help your ideas to be better understood and communicated. Finally, it would be beneficial if the authors could explain more clearly why the staphylococcus load was set at 10^5 , thus providing a solid basis for understanding this crucial data. These adjustments will certainly contribute to the clarity and relevance of your article, while consolidating its impact in solving the problem studied.

It would be beneficial to further enrich the "Materials and Methods" section of your article by providing more in-depth details. This section is the backbone of any research, providing readers with a clear understanding of the methodology employed. To increase the transparency of your study, please detail the experimental procedures step by step, highlighting specific techniques, instruments used, and experimental conditions. In addition, be sure to include information on the validity and reliability of measuring instruments, as well as sample quality control protocols. A detailed "Materials and Methods" section will enhance the credibility of your research and enable researchers to reproduce your experiments accurately, thus contributing to the robustness of your results and the validity of your conclusions.
