

Review of: "Covid-19 vaccine uptake and its associated factors among rural households in The Gambia: a community-based cross-sectional study"

Hayat Ben-Saghroune

Potential competing interests: No potential competing interests to declare.

The manuscript is well structured, but there are many shortcomings in the presentation and interpretation of the results. It's a pleasure to give my comments.

The abstract is very long.

The sample selection and determination need further explanation.

The study period is very short.

The authors should enrich this part, whether by making it more coherent or updating the literature. It is better to update the literature. I recommend some additional references such as:

- Dataset to explore factors affecting COVID-19 vaccination intention. Evidence from Morocco
