

Review of: "Throwing is affected by self-movement"

Zhanneta Kozina Kozina

Potential competing interests: No potential competing interests to declare.

1. The title does not reflect the essence of the study. It is not indicated what exactly was studied in throwing, accuracy or range. The name also indicates that throwing depends on its own movement. In our opinion, this is not true, since throwing is a movement, and, of course, it depends on the movement of the one who performs it. In addition, the article does not analyze the parameters of movement, but analyzes the perception of distance. Therefore, in our opinion, a name would be more appropriate, for example: "Dependence of the accuracy of throwing on the perception of distance."
2. For some reason, Figure 2 is placed before Figure 1. They must either be renamed or swapped.
3. There are not enough explanations in the captions in the drawings. What do the plus signs mean in the drawings, what do the other elements in the drawings mean. - everything must be signed and decrypted.
