

Review of: "The Truth about the Origin of Omicron"

Potential competing interests: The author(s) declared that no potential competing interests exist.

This review article describes the Omicron variant and how it is transmitted from mice to humans. The author discusses the current hypothesis, the research being conducted, and the probable consequences. Although the content is well written, they could improve on the concise writing and definitely add more literature-based surveys, published ideas, and hypotheses related to the subject. In addition to the literature, I recommend providing relevant facts or figures to support the content in a table/figure. Many articles/correspondence are written in nature, science, etc., the author should add. Errors must be corrected, such as pike to spike protein, etc.
