The manuscript is well written. It contains the well-discussed methods for the prevention of cancer by using cinnamon and its bioactive compounds.

- Why didn't the author propose any diagrammatic presentation of the pathways that actually show alterations in metabolic pathways?
- What is the amount of bioactive compound yielded from cinnamon, and how is it required for cellular mechanism functioning?
- Along with the Nrf pathway, does the cinnamon bioactive compound affect other cellular activities? If yes, elaborate.
- Justify the reason behind selecting cinnamon as a cancer preventive agent.
