Dear author,

Thank you for your manuscript.

Despite being the topic - the connection between the trunk range of motion and the prosthetic gait - very interesting, the way it is presented in this case report should be improved.

A detailed method section is missing, with body-related information about the patient, and a thorough explanation of the rehabilitation process, with figures.

A separate section for the results is also needed. Data quantifying the outcomes are required to better understand the improvements in patient's mobility.
