Potential competing interests: No potential competing interests to declare.

The manuscript opens the door to discuss and suggest new models based on the variables mentioned by the authors. Although the implementation of the suggested model is not easy, I think the information presented is a good exercise.

The MS is well written and deserves publication. Minor revisions are required from my review.

1. The title of the MS relates to [researcher success], however, the author only focused on researcher publication.
2. I recommend including the peer review activity of the researcher as an indicator of researcher success. The author can read and discuss the recently published study in (doi.org/10.1007/s11192-022-04611-3).
3. The author can also discuss the cite-score (from Scopus) in addition to impact factor (from WOS)
4. In Box 1, equations under "or" need explanation.

I really enjoyed while reading the MS and wishing all the best to the author.
