**Potential competing interests:** No potential competing interests to declare.

This study exploring the contraindications for intermittent sequential pneumatic compression (ISPC), doctors should follow the manufacturer's recommendations for a specific pneumatic compression device model, while manufacturers tend to defer clinical decision-making to the doctor. Contraindications can be determined through expert assessments, leading to discrepancies in sources, or based on empirical experience. The formulation should specify the conditions under which the described condition becomes a contraindication. Attention should be devoted to studying the systemic effects of ISPC. Trust in contraindications recommended by the manufacturer regarding a specific device model, procedural methodology, or working conditions should be fundamental. Simultaneously, ongoing research on ISPC safety aspects and continuous monitoring of new contraindication data are necessary.

Overall, the novelty, concept, manuscript writing of this study are all good enough for publication. This paper could be accepted for publication.
