# Cefonicid Monosodium

National Cancer Institute

## Source

National Cancer Institute. *Cefonicid Monosodium*. NCI Thesaurus. Code C76170.

The monosodium salt form of cefonicid, a second-generation, semi-synthetic, beta-lactam cephalosporin antibiotic with antibacterial activity. Cefonicid binds to penicillin-binding proteins (PBPs), transpeptidases that are responsible for crosslinking of peptidoglycan. By preventing crosslinking of peptidoglycan, cell wall integrity is lost and cell wall synthesis is halted.
