Pyramidal molars-abnormal upper lip syndrome

INSERM

Source

INSERM. (1999). Orphanet: an online rare disease and orphan drug data base. Pyramidal molars-abnormal upper lip syndrome. ORPHA:2561

Ackerman syndrome is characterized by pyramidal molar roots and taurodontism, associated with variable anomalies. It has been described in two generations of one family. Both parents and their six sibs had pyramidal, taurodont or fused molar roots. Some of the patients also had hypotrichosis, an abnormal upper lip, thickened and wide philtrum, and/or juvenile glaucoma. Other features included entropion of the eyelid, syndactyly and clinodactyly of the fifth fingers.
