Potential competing interests: No potential competing interests to declare.

This study touched on an important topic in terms of food health and animal production. The research axes are very consistent in terms of defining the title, identifying the problem, and methods of diagnosing it, as well as relying on previous studies in presenting and determining the rates of spread of the disease. The study is excellent, but it would have been better if more efficient diagnostic techniques were used to determine the actual pathogen and reveal the possibility of genetic differences that may be renewed by environmental factors and the surrounding conditions of the animal.

In conclusion, excellent efforts, thank you
