

Review of: "Hydroxyapatite coating techniques for Titanium Dental Implants — an overview"

Xueni Zhao

Potential competing interests: No potential competing interests to declare.

The manuscript introduces Hydroxyapatite coating techniques for Titanium Dental Implants. It is just technology overview but not an academic review. The research work (the purpose of study, method and material, results, discussion and conclusion) on Hydroxyapatite coating techniques should be summarized and involved in the manuscript. For example, the author mentioned that the pore size and porosity of HA coating have an effect on the performance of porous titanium scaffold, but the process parameters related to the pore size and porosity of HA coating were not included in the coating preparation technology. The key issues in current Hydroxyapatite coating techniques for Titanium Dental Implants should be mentioned and discussed in depth. The research progress and prospect of the future study should also be presented.
