**Potential competing interests:** No potential competing interests to declare.

The title of this manuscript suggests an analytical work conducted by the authors on the basis of modern references, relying on sources from 2017 to 2023.

However, the manuscript raises many serious comments that do not allow me to recommend its publication:

1. The abstract, main text, and list of references used in this manuscript were compiled from three different and independent sources. The authors need to carefully review the list of cited sources; they should find current references with the results of dental studies as confirmation of dental theses instead of using references to the results of studies "from patients with urinary tract infection in Al-Najaf City, Iraq".
2. The methods described in the abstract are not supported by anything in the main text of the manuscript.
3. The main text of the manuscript comprises several slogans that the authors do not support with current data from world literature sources.
4. A very high level of self-citation for the hypotheses that have better and more recognized analogs around the world.
