It is a great honor to assess this comprehensive summarizing work. I am pleased to see (as in the prior position statements from the Italian societies) a clinico-radiographic staging. Since this pathology can manifest through a variety of non-specific signs and symptoms, it is extremely important to be alert not only of bone exposure in patients being treated with antiresorptive and antiangiogenic drugs. This classification should be discussed internationally!

This is a stunning paper for anyone who wants to learn about MRONJ for the first time or renew their knowledge. Congratulations to the authors.
