The present study tried to mention the underlying mechanism of ME/CFS and figure out these possibly causal relation factors. The immunological effect should exist complexity in etiological factors. This study comprehensively pointed out these factors and networks. However, the observational study in human beings was limited the diagnosis accuracy and small sample size, which might lead to challenging to classify the ME/CFS via different variables. In these differential ethnicities, differential patterns of various phenome in ME/CFS demonstrated minor evidence-based observation. The differential patterns should demonstrate specific phenome, and the present study summarized these underlying mechanisms or networks for clarifying these pathways, such as immunological, neurological, and relationship. Further study of mechanisms or functional studies should help us know the associations between these biological hypotheses and etiological factors.
