Adenoviral Cancer Vaccine PF-06936308

National Cancer Institute

Source

National Cancer Institute. *Adenoviral Cancer Vaccine PF-06936308*. NCI Thesaurus. Code C156015.

A cancer vaccine composed of a replication-defective E1-deleted adenovirus vector based on chimpanzee adenovirus serotype 68 (AdC68) expressing three not yet disclosed tumor-associated antigens (TAAs), with potential immunostimulating and antineoplastic activities. Upon vaccination with the adenoviral cancer vaccine PF-06936308, the adenovirus infects cells and expresses the TAAs. In turn, the TAAs activate the immune system to produce a cytotoxic T-lymphocyte (CTL) response against cells expressing the TAAs.
