Potential competing interests: No potential competing interests to declare.

This paper proposes three relevant research questions. Introduction includes clear arguments, objectives are well formulated, and the methodology is sound.

However, something is lacking in the analysis of results and in the discussions, which need to be improved. Result analysis include a number of sentences that still build on the introduction discourse, simply providing basic definitions that partially fail in responding to research goals. Note also that RQ3 was practically not addressed.

After reading the manuscript one still has doubts: practically speaking, which are the benefits and the costs of applying blockchain technology to EV payments?
