Potential competing interests: No potential competing interests to declare.

This is an interesting study and a timely topic for investigation. It conducts an ES-CFD coupled analysis to examine the differences in convective heat transfer coefficients resulting from varying insolation conditions and the surroundings of the target buildings. The paper is well-written and well-structured, featuring an extensive literature review and comprehensive analyses. It is clear and readable, and the conclusions drawn from the study offer valuable findings that could significantly contribute to further developments in the related field. This article makes an excellent contribution to knowledge in that area and would serve as a great resource for other scholars working in the field.
