

Review of: "Numerical Study of Thermal Performance on Fin and Tube Heat Exchanger with Flat Rectangular and Sinusoidal Winglet Vortex Generators"

Zaid A. Shaalan

Potential competing interests: No potential competing interests to declare.

The authors should provide a detailed abstract detailing the potential significance of their findings, including their primary contributions and problem statement. They should also update their conclusion to include relevant key findings. The authors should compare their work to similar studies and discuss their uniqueness. The introduction should address research gaps and provide a strong argument for the study's value. The abstract and conclusions should both contain concise descriptions of the work's contribution. The authors should also consider formatting equations and figures correctly, as Word's Office version may differ. The authors should provide more interpretation of the data in their results and illustrate how their findings will contribute to the existing body of knowledge. The governing differential equations are not completely described or mentioned.
