Sorry for the delay and many thanks for the opportunity to read and review this article.

After the previous revision this article has improved a lot. You better described the main goals for the project, better defined the methodology used and mainly, present results even if they may not be exclusive to your project.

As a suggestion for improvement, I think that the results presented are good, however they do not exclusively demonstrate the results of the work carried out in the company PT.X. These results are largely a consequence of the global resolution of the problem (COVID-19). The same type of trend inversion can be seen in many other activities and companies, even in companies that did not take any action to mitigate risks to the business continuity plan.

I think you could improve, complementing the current generic results of sales and production, with results exclusive to your project. For example, you could present the Score of the risk analysis to the business continuity plan, before and after your performance.

This comment is just a possible contribution to your work; however, I ask you to read and think if it is possible to apply.

I hope I helped you.
