I recognize the significance of this work due to the continued relevance of the PFAS topic worldwide, including Africa. However, it's important to note that this article is merely a summary of a survey, not a fully-fledged scientific paper. Critically, there's a lack of thorough discussion with existing literature, which is essential for contextualizing the findings. Moreover, to enhance the depth of insights and their potential impact on future studies, it's recommended to utilize statistical tools like ANOVA or significance assessment. These tools can provide a more comprehensive understanding of the study's implications and contribute to advancing research in this area. Overall, I would suggest that authors should significantly improve the scientific depth of the paper.
