The aim of this research is to study "Individual and Environmental Risk Factors for COVID- 19 Mortality in Elderly". The research is interesting and helpful for researchers to understand the Environmental Risk Factors in COVID- 19 Mortality in Elderly. However, after careful review, some concerns should be addressed before publication. Minor revision is suggested to further improve its quality. Specific suggestions are provided below.

1. The quality of abstract should be improved. The current abstract is too long.
2. Overall, there are too many punctuation errors in the manuscript:
 - 2.1 In introductory part, especially in the first paragraph.
 - 2.2 Add a full stop (i.e cancer, diabetes..) in legend of figure 4.
 - 2.3 Remove the one brackets symbols from (UV index)) the legends of Figures 6.
 - 2.4 Add space between "response[5]" in section 4.1.2 in paragraph 4.
 - 2.5 In *Weather parameters and COVID-19 mortality*: section add space between [9,24] in paragraph 1 and [5,9] in paragraph 3 and add a comma before "However" in paragraph 1.
 - 2.6 Removed the one full stop (.) from the (72.2 to 43.9 µg/m3..) in section 3.2.
3. It is suggested that the authors re-review the meaning of (positivy and wether) in section 3.1.
4. The author has not correctly defined ozone concentration (72.2 to 43.9 µg/m3) in section 3.2 according to the values in Figure 3.
